

JavaScript data types

With explanations and code
examples.

Primitive Data Types

String

Represents textual data.

```
let name = "Alice";  
console.log(typeof name) //  "string"
```

Number

Represents both integers and floating-point numbers.

```
let age = 25;  
let pi = 3.14;  
console.log(typeof age); // "number"
```

BigInt

Represents integers larger than
Number.MAX_SAFE_INTEGER.

```
let bigNumber = 123456789012345678901234567890n;  
console.log(typeof bigNumber); // "bigint"
```

Boolean

Represents logical values:
true or false.

```
let isActive = true;  
console.log(typeof isActive); // "boolean"
```

Undefined

A variable declared but not assigned a value.

```
let value;  
console.log(value);           // undefined  
console.log(typeof value);   // "undefined"
```

Null

Represents no value
(intentional absence).

```
let data = null;  
console.log(data);           // null  
console.log(typeof data);    // "object"  
(this is a known JavaScript quirk)
```

Symbol (ES6)

Represents unique
identifiers.

```
let id = Symbol("id");  
console.log(typeof id); // "symbol"
```
